# Blockchains & Distributed Ledgers

Lecture 01

Aggelos Kiayias

#### Introduction

- Introduction to Blockchain
- What is money?
- The never-ending book parable
- Cryptocurrencies from a user's perspective

Why study Blockchains?

#### Why study Blockchains?

- Provide good foundations for exploring the security of information systems in general.
- Highlight the importance of decentralisation, a property of increasing importance in the design of modern information systems.
- Facilitate a solid understanding of many security critical components, incl.
  - Key management.
  - Software security.
  - Privacy preserving technologies.
  - o Public Key Infrastructure.
- They have an increasing impact on various aspects of societal organisation.
- It's fun!

What is a blockchain?

#### What is a blockchain?

- A blockchain is a distributed database that satisfies a unique set of safety and liveness properties.
- Distributed ledgers use blockchain protocol as one means of implementation.
- To understand it, we can focus to its first (and so far most successful)
  application.

## Case study: Money

(1874) A man offering chicken for a yearly newspaper subscription

#### Properties of Money

- A medium of exchange: Can be used as medium for the exchange of goods
   no bartering
- A unit of account: Can be used for pricing of all goods and services, for accounting purposes and debt recording
- A store of value: Storing and retrieving it at a point in the future maintains its value.

# Money 1.0: Using a trusted object

#### Analysis of Money 1.0

- A medium of exchange: Medium
  - Ok to face to face transactions
- A unit of account: Mediocre
  - Fungible, but not divisible well
  - Typically forgeable
- A store of value: Bad
  - Some objects may deteriorate.
  - May have unknown hidden quantities.

# Money 2.0: Using a trusted entity

#### Analysis of Money 2.0

- A medium of exchange: good
  - For transactions within the domain of the trusted entity
- A unit of account: great
  - Fungible & divisible
- A store of value: Mediocre
  - Tied to the availability & reputation of the issuing entity

## Money 3.0: Using cryptocurrencies

# The never-ending book parable

#### A book of transactions

- Anyone can be a scribe and produce a page.
- New pages are produced indefinitely as long as scribes are interested in doing so.
- Each new page requires some effort to produce.

## Importance of consensus

If multiple conflicting books exist, which is the "right one"?

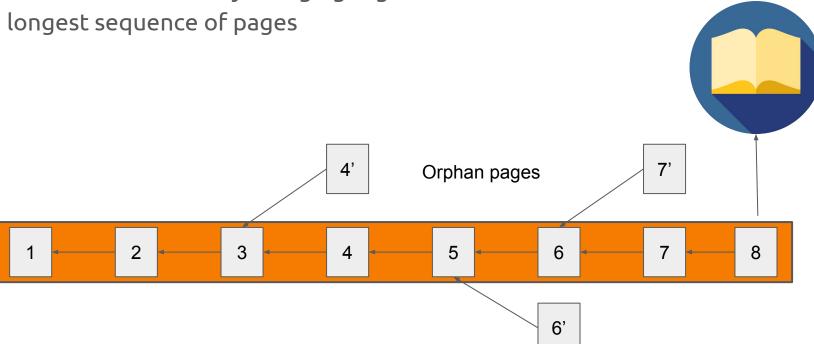

## Choosing the correct book?

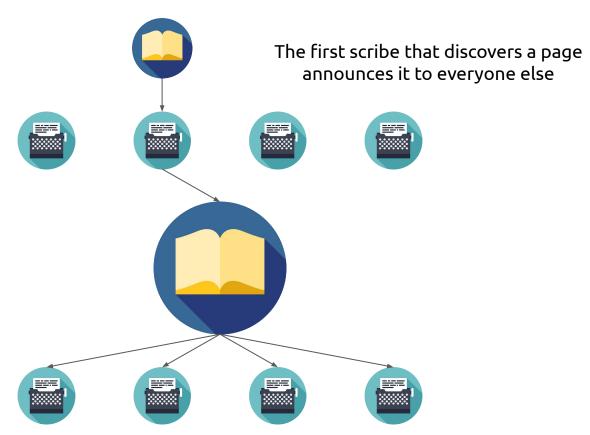

The correct book to work on & refer to is the book with the most pages. If multiple exist, just pick one at random.

#### Assembling the current book

- Each page refers only to the previous one
- Current assembled by stringing together the

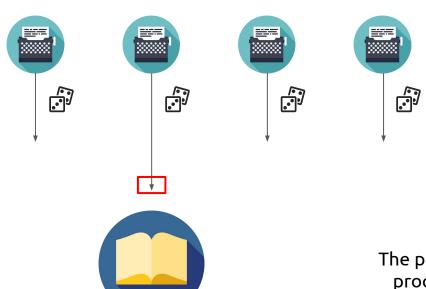

# Rules of extending the book

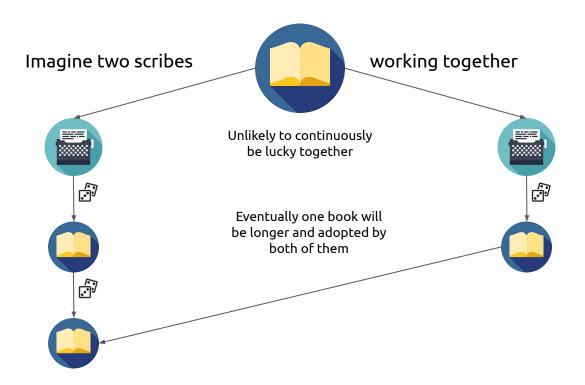

### Effort is needed to produce a page

Equivalent to: each page needs a special combination from a set of dice to be rolled.

The probabilistic nature of the process is paramount to its security

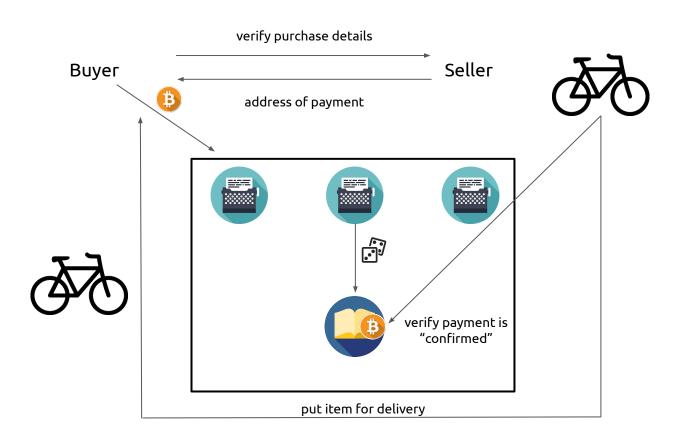

#### The benefits of randomness

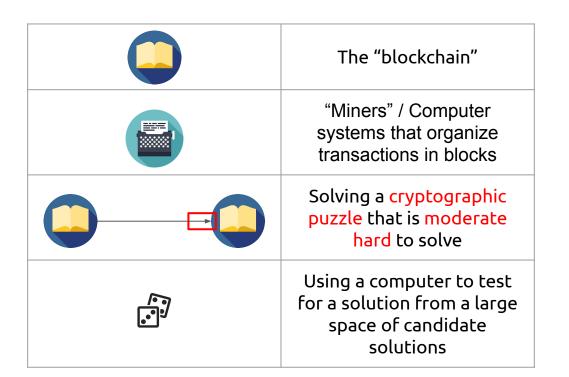

#### Being a scribe

- Anyone can be a scribe for the book.
- As long as one has a set of dice.
- The more dice one has, the higher the likelihood to produce the winning combination to make a page.

# Using the book

# Parable & Reality

#### Analysis of Money 3.0

- A medium of exchange: improving
  - assuming internet connectivity / adoption
- A unit of account: good
  - Fungible\* & divisible
- A store of value: good
  - No trusted parties
  - No natural deterioration

#### Word of caution

#### Smart contract

#### From Money to Smart Contracts

- Since we have created the book, why stop at recording monetary transactions?
- We can encode in the book's pages arbitrary relations between persons.
- Furthermore, scribes, can perform tasks such as verifying that stakeholders comply to contractual obligations ... and take action if they do not.

#### Questions to Consider

- How are pages created? Since the book is empty at the beginning, where do the money come from?
- How is it possible to sign something digitally?
- How does a page properly refer to the previous page?

#### Questions to Consider

- How are pages created? Since the book is empty at the beginning, where do the money come from? - Proof-of-Work
- How is it possible to sign something digitally? Digital signatures
- How does a page properly refer to the previous page? Hash functions

#### Hash Functions

- An algorithm that produces a fingerprint of a file.
- what are the required properties (traditionally):
  - a. Efficiency
  - b. A good spread for various input distributions.
- What are Security/Cryptographic considerations

$$\mathcal{H}: \{0,1\}^* \to \{0,1\}^{\lambda}$$

#### Collision resistance

Collision attack

Find 
$$x, y : \mathcal{H}(x) = \mathcal{H}(y)$$

Second pre-image attack

Find 
$$y: \mathcal{H}(x) = \mathcal{H}(y)$$

For given x

## Birthday paradox

 How many people should be in a room so that the probability that two of them share a birthday becomes larger than 50%?

# Paradox explained

n possible dates

k people

$$\Pr[\neg Col] =$$

$$\frac{n}{n} \frac{n-1}{n} \frac{n-2}{n} \dots \frac{n-k+1}{n} = \prod_{\ell=1}^{k} (1 - \frac{\ell}{n})$$

$$\leq \exp(-\frac{1}{n} \sum_{\ell=1}^{k} \ell) = \exp(-k(k+1)/2n)$$

$$\exp(-\frac{1}{n}\sum_{\ell=1}^{n}\ell) = \exp(-k(k+1)/2n)$$

$$\Pr[Col] = \frac{1}{2} \Rightarrow k \approx 1.177\sqrt{n}$$

#### What do we learn about collision finding?

Describe an algorithm that finds collisions taking advantage of the Birthday paradox.

#### Pre-image attack

Given 
$$\mathcal{H}(m)$$
  $m \in \{0,1\}^t$ 

Find an element of  $\mathcal{H}^{-1}(\mathcal{H}(m))$ 

Generic algorithm tries all possible candidates Complexity: ?

#### One-way functions

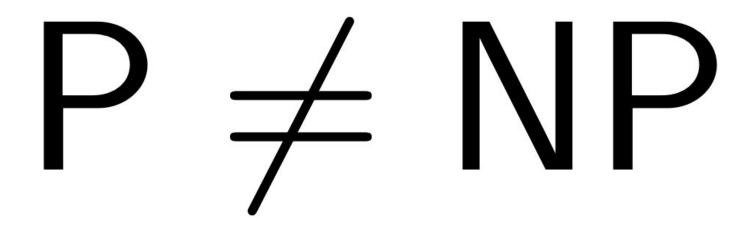

$$f: X \to Y$$

easy: given x find f(x)

hard: given f(x) sample  $f^{-1}(f(x))$ 

#### Does one-way functions exist?

Relates to most important open question in computer science right now:

#### Hash function instantiations

- Retired. MD5, SHA1.
- **Current.** SHA2, SHA3, available for 224,256,384,512 bits fingerprints.
- Bitcoin. Uses SHA2 with 256 bits output, SHA-256.

#### Digital Signatures

- Can be produced by one specified entity.
- Can be verified by anyone (that is suitably "equipped" and "initialised").
- Cannot be forged on a new message even if multiple signatures have been transmitted.

#### Digital Signatures

Three algorithms (**KeyGen**, **Sign**, **Verify**)

**KeyGen**: takes as input the *security parameter*. returns the signing-key and verification-key.

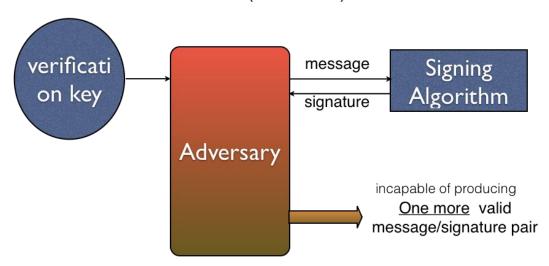

**Sign**: takes as input the *signing-key* and the *message* to be signed and returns a signature.

**Verify**: takes as input the *verification-key*, a *message* and a *signature* on the message and returns either True or False.

#### Digital Signature Security

### Digital Signature Security

Existential Unforgeability under a Chosen Message Attack (EU-CMA)

#### Constructing Digital Signatures

- Major challenge:
  - what prevents the adversary from learning how to sign messages by analyzing the verification-key?
- Exercise: construct a digital signature based on a hash-function that is one-time secure (i.e., it is secure for signing only a single message)

#### Digital Signature Implementations

- Based on the RSA (Rivest Shamir Adleman), one way trapdoor function (with hardness that relates to the factoring problem).
  - The RSA algorithm
- Based on the discrete-logarithm problem.
  - the DSA algorithm
- Bitcoin. Uses ECDSA, a DSA variant over elliptic curve groups.

#### Proof of Work

Objective: given some *data* ensure that some amount of work has been invested for them.

```
int counter;
counter = 0
while Hash(data, counter) > Target
    increment counter
return counter
```

In this case: proof-of-work of data equals to a value w with the property Hash $(data, w) \le Target$ 

(Informal) Properties: efficient verification, no computational shortcuts (i.e., independent of algorithm that computes it complexity is proportional to Target), independence for symmetry-breaking.

#### Proof-of-Work Algorithms

Hashcash (as in previous slide)

Memory hardness

ASIC resistance (ASIC = application specific integrated circuit).

A number of algorithms proposed: scrypt, argon, progpow

# Cryptocurrencies from a user's perspective

## Bitcoin

What is bitcoin?

#### Bitcoin / bitkoin/

- First decentralized digital currency.
- Digital coins you can send through the Internet.

## Advantages

#### Person to person

#### Fees determined by free market

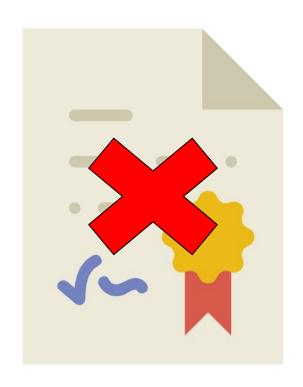

#### Available to the whole world

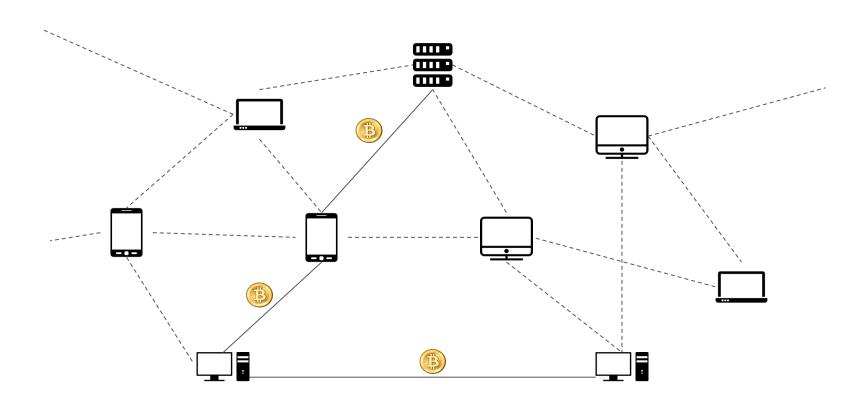

#### You own your account

#### No prerequisites or arbitrary limits

#### Trust to third party is not a requirement

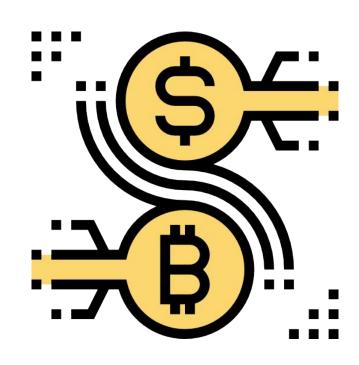

#### Open source: Anyone can review the code

# Great! But... how can I use it?

#### Exchange: Buy or sell bitcoin for various currencies

## Digital wallet: Bitcoins are kept in your computer or mobile device

### Transactions: Bob wants to buy a coffee from Alice

## Transactions: Bob pays Alice by sending the proper amount to Alice's bitcoin address

## Exchanges

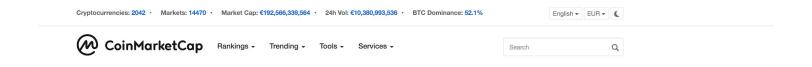

#### Exchanges

- Bittrex
- Kraken
- Coinbase
- CoinMama
- SpectroCoin
- BitPanda
- LocalBitcoins (Buy / Sell from people near you)
- Bisq (Decentralized)
- Friends!!

#### Order book

## Addresses

#### Addresses

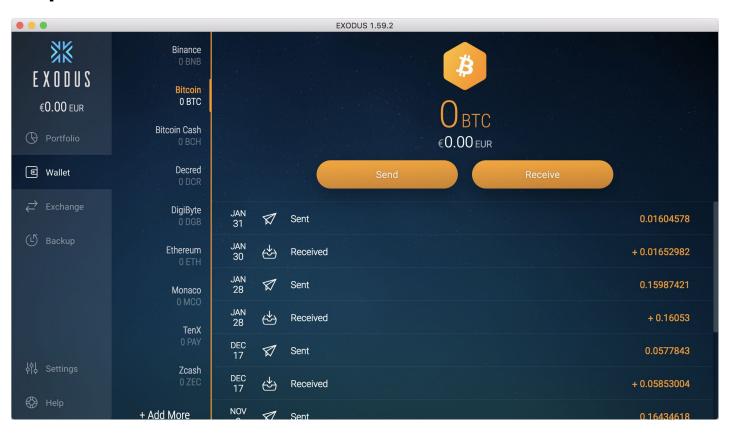

- Like an email address.
- You send bitcoins to a person by sending bitcoins to one of their addresses.
- You can have as many addresses as you want.
- No need to be online to create an address.
- Pseudonymous: A unique address should be used for each transaction.
- Most wallets do it automatically.

#### Addresses

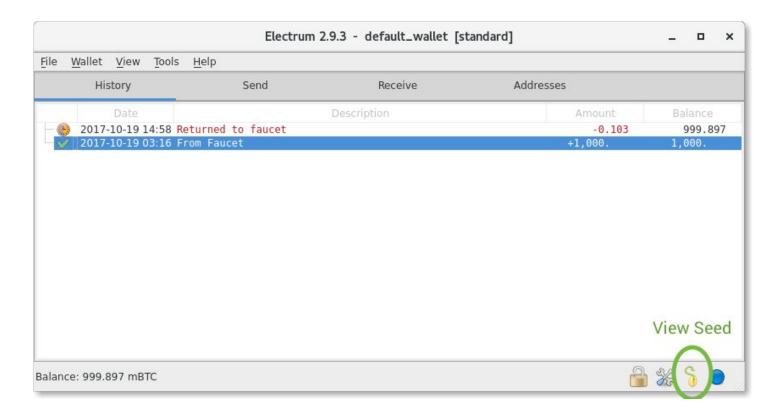

Wallets

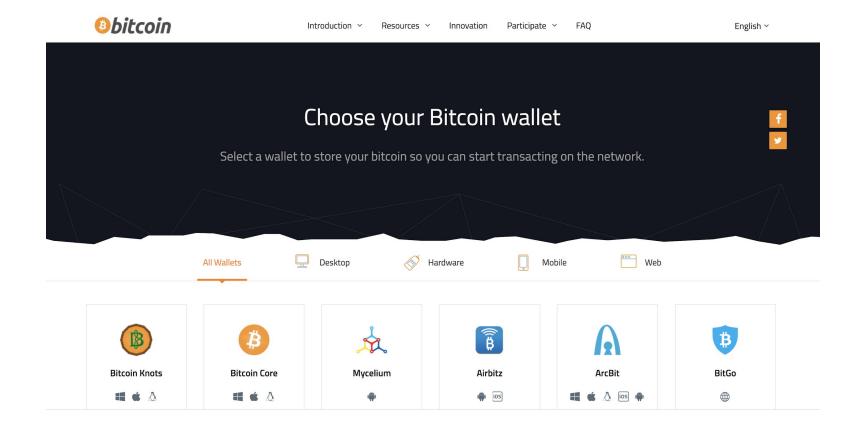

#### Desktop Wallet - Exodus

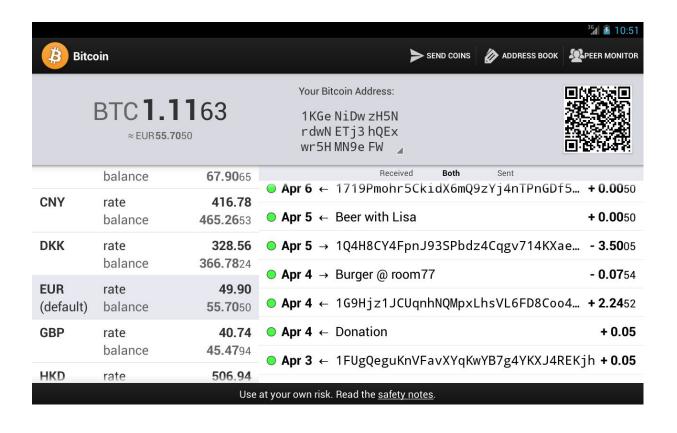

# Desktop Bitcoin Wallet - Electrum (open source)

## More Bitcoin wallets ... (mobile)

#### Mobile wallet - Android

#### Hardware wallets

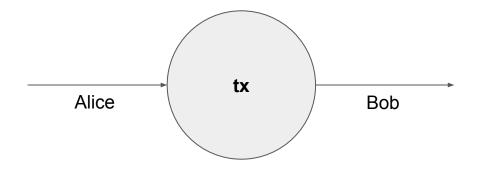

# Explorers

## Explorers

- An online blockchain browser.
- Displays the contents of individual blocks and transactions
- Displays the transaction histories and balances of addresses.
- Quick way to see if your transactions are confirmed.
- Bitcoin:
  - https://www.blockchain.com/explorer (Mainnet)
  - https://testnet.blockexplorer.com/ (Testnet)
- Ethereum:
  - https://etherscan.io/ (Mainnet)
  - https://ropsten.etherscan.io/ (Testnet)
  - https://rinkeby.etherscan.io/ (Testnet)

## Development

- Local blockchains: e.g., ganache
  - Used for local development.
  - o Instant mining.
  - Very small in size.
  - In class we will use our own ETH deployment.
- Testnets:
  - Used for testing and experiment. Very useful specifically for smart contract development.
  - Different blockchain and different genesis block.
  - Coins are separated and distinct from actual coins (with no real value).
  - Different ports and DNS seeds.
  - Bitcoin: Testnet3 (Run bitcoin or bitcoind with the -testnet flag)
  - Ethereum: Rinkeby, Ropsten, Kovan
- Main net (production):
  - Blockchains are immutable and irrevertible.
  - You cannot simply update your code once deployed!

#### **Faucet**

- A way to get test coins necessary for any testing.
- Ethereum:
  - https://faucet.rinkeby.io/
  - https://faucet.metamask.io/
  - https://faucet.ropsten.be/
- Bitcoin:
  - http://tbtc.bitaps.com/
  - https://bitcoinfaucet.uo1.net/
  - https://testnet-faucet.mempool.co/
  - https://block.io/ (Online testnet wallet)

#### Enter your testnet account address

Enter your testnet account address

Send me test Ether

This faucet drips 1 Ether every 30 seconds. You can register your account in our queue. Max queue size is currently 5. Serving from account 0x687422eea2cb73b5d3e242ba5456b782919afc85( balance 2,559,755 ETH).

Example command line: wget https://faucet.ropsten.be/donate/<your ethereum address>
